Inventory Performance Dashboard

Project problem statement, business glossary, KPI definitions and analytical scope

1. Problem statement

Inventory and commercial teams need a consolidated view of product revenue, profitability, expenses and stock movement. Reviewing individual product-month-supplier records makes it difficult to compare categories, identify high-volume items and monitor the relationship between incoming and outgoing stock. This Excel project organizes the records into an interactive inventory performance dashboard for monthly and product-level monitoring.

2. Project objectives

• Monitor revenue, profit, expenses, units sold and profit margin.

• Compare monthly, category, product and supplier performance.

• Examine stock received and stock issued to identify movement patterns.

• Support filtering and recurring Excel-based reporting.

3. Workbook inventory and scope

The macro-enabled workbook contains Data, Pivot and Dashboard sheets. Data contains 365 records and nine fields, covering 12 month labels, four categories, seven products and five suppliers. Pivot holds aggregated tables and Dashboard presents five headline KPIs. The year, data origin, currency and business ownership are not stated.

4. Headline measures

Revenue: 4,536,842 (currency unspecified)

Profit: 2,949,228

Expenses: 1,587,614

Stock In: 25,834 units

Stock Out / dashboard Units Sold: 15,040 units

Profit margin: 65.01%

Largest revenue category: Electronics (1,847,552)

5. Data dictionary and terminology

Field	Meaning / caution
Month	Three-letter reporting month; the workbook does not specify a calendar year.
Category	Merchandise grouping: Clothing, Electronics, Footwear or Accessories.

Product	Product name associated with a sales and stock record.
Supplier	Supplier name assigned to the record; supplier contracts and costs are not provided.
Revenue	Recorded sales value for the row; currency unspecified.
Profit	Recorded profit; in the dataset it equals Revenue minus Expenses.
Expenses	Recorded costs associated with the row; no detailed cost breakdown supplied.
Stock In	Units received or added to inventory in the record.
Stock Out	Units removed from inventory; the dashboard labels the sum Units Sold, though other stock movements are not separately identified.

6. KPI definitions

• Total revenue = SUM(Revenue).

• Total profit = SUM(Profit).

• Total expenses = SUM(Expenses).

• Units sold (dashboard convention) = SUM(Stock Out).

• Profit margin = SUM(Profit) / SUM(Revenue).

• Stock movement difference = SUM(Stock In) − SUM(Stock Out); this is not a verified closing inventory balance.

7. Suggested analysis questions

• Which categories and products generate the most revenue and profit?

• How does profitability change by month?

• Which suppliers are associated with the greatest sales value?

• Which products have the largest stock-out volumes?

• Where does stock-in exceed stock-out most substantially?

8. Data quality and limitations

No blank values were observed in the 365 data records. Revenue equals Profit plus Expenses across the records. No unique transaction ID, exact date, year, currency, opening inventory, stock adjustment reason or unit prices are supplied. Stock Out is presented as Units Sold in the dashboard but is not independently verified as customer sales. The data does not support inventory turnover or stockout-rate calculations without opening/closing balances and demand data. Check macro security and distribution rights before publishing the .xlsm file.

9. Tools and deliverables

Microsoft Excel macro-enabled workbook (.xlsm), source data, pivot summaries and an inventory dashboard. GitHub deliverables: workbook where distribution is permitted, PDF documentation, README.md and optional dashboard screenshot.

10. Portfolio description

Built an Excel inventory performance dashboard using 365 product-supplier-month records to analyze revenue, profit, expenses and stock movement. Developed KPI reporting and pivot summaries for monthly, category and product comparisons, with clear limitations around stock-out interpretation and unspecified reporting year.
